

Changing Habitats — Answer Key

Habitats • Level 4

A. Look at the before/after pictures — what has changed?

Forest. A full green forest, then the same area with most trees cut down. What happened, and how might it affect animals?

Answer: The trees were cut down (deforestation). Animals that lived there lose their homes, shelter and food, and must move away or may not survive.

Ocean. A clean blue ocean with coral and fish, then the same ocean with plastic bottles and rubbish floating in it. What happened, and how might it affect animals?

Answer: The ocean became polluted with plastic litter. Sea animals can get sick, hurt or tangled in the rubbish, or accidentally eat plastic, and the pollution can damage coral.

Pond. A pond full of water with lily pads and a frog, then the same area dried into cracked mud. What happened, and how might it affect animals?

Answer: The pond dried up (drought). Animals like frogs and fish that need the water lose their home and may die or be forced to move to find water elsewhere.

B. Choose the best way to help.

1. A forest is being cut down — plant more trees, throw rubbish, or build more roads?

Answer: plant more trees

2. A river is dirty — clean it up, add more plastic, or waste water?

Answer: clean it up

3. A pond is drying out — save water, pour oil in, or scare animals away?

Answer: save water

4. Animals have lost their homes — protect habitats, cut more trees, or pollute the area?

Answer: protect habitats

C. Tick the good ideas.

1. recycle

Answer: Yes — tick it

2. plant trees

Answer: Yes — tick it

3. leave litter

Answer: No — don't tick it

4. save water

Answer: Yes — tick it

5. protect wildlife

Answer: Yes — tick it

6. pollute rivers

Answer: No — don't tick it

D. Why should we protect habitats?

Answer: Habitats give animals and plants the food, water, shelter and space they need to survive — protecting them keeps animals safe and keeps nature and our planet healthy.
