

Weather Data Challenge — Answer Key

Weather and Water • Level 4

A. Five-day weather table.

Monday: sunny, 26°C, 0 mm • **Tuesday:** rain, 20°C, 8 mm • **Wednesday:** cloudy, 22°C, 1 mm • **Thursday:** windy, 24°C, 0 mm • **Friday:** rain, 18°C, 12 mm.

Answer: Note: Wednesday shows a plain cloudy icon but 1 mm of rainfall — a small inconsistency in the original table. This key treats Tuesday and Friday (rain-cloud icons, the two heaviest rainfall totals) as the "rainy days".

B. Answer the questions using the table.

1. Which day was the warmest?

Answer: Monday (26°C, the highest temperature).

2. Which day had the most rain?

Answer: Friday (12 mm, the highest rainfall).

3. How many rainy days were there?

Answer: Two — Tuesday and Friday (Wednesday's 1 mm is a minor exception noted above).

4. Which day would be best for a picnic?

Answer: Monday — sunny, 0 mm rain, and a warm, comfortable temperature.

C. True or False?

1. Friday was the coolest day.

Answer: True — 18°C is the lowest temperature shown.

2. Thursday had more rain than Tuesday.

Answer: False — Thursday had 0 mm, Tuesday had 8 mm.

3. There were two rainy days.

Answer: True — Tuesday and Friday.

4. Monday and Thursday had no rain.

Answer: True — both list 0 mm of rainfall.

D. Why do scientists record weather data?

Answer: So they can spot patterns and compare days — which are warmer, wetter or windier — to help predict future weather and warn people about storms or extreme conditions.
